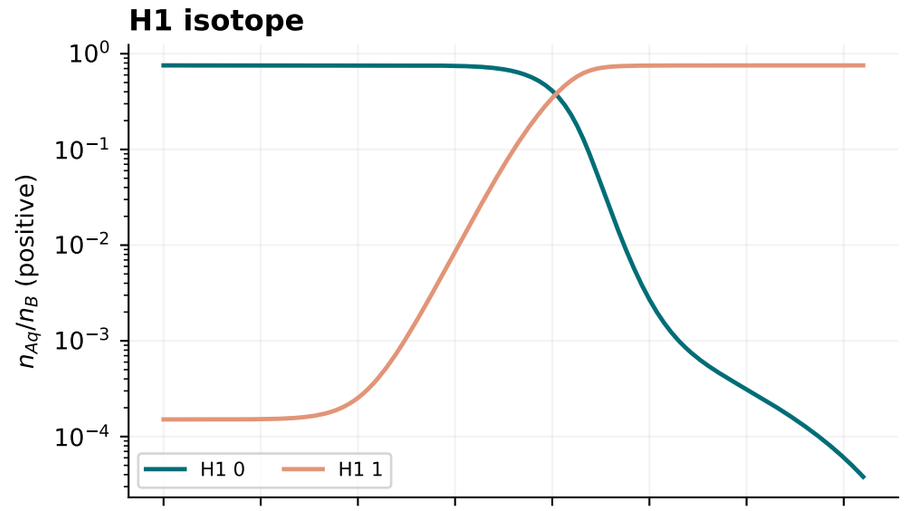
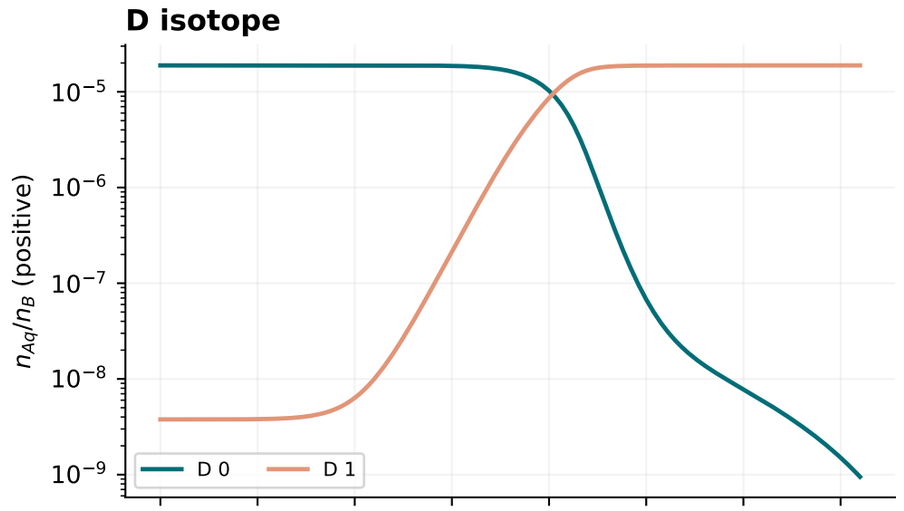
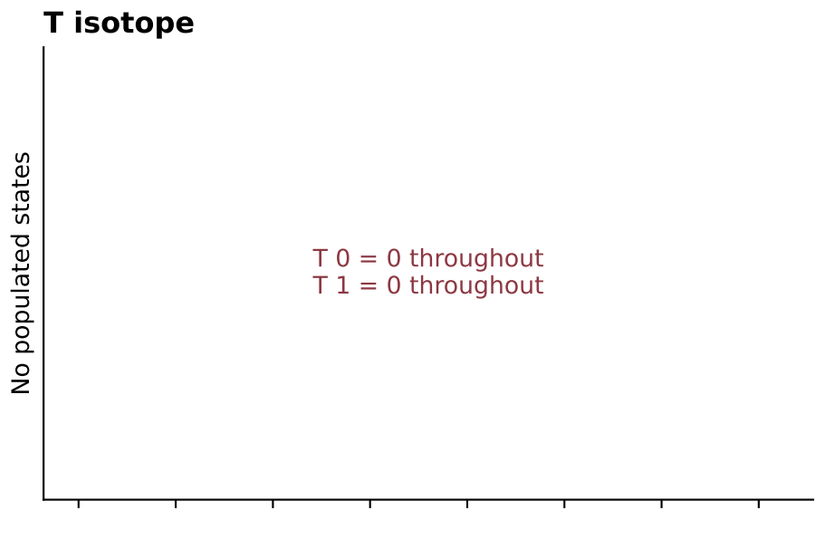
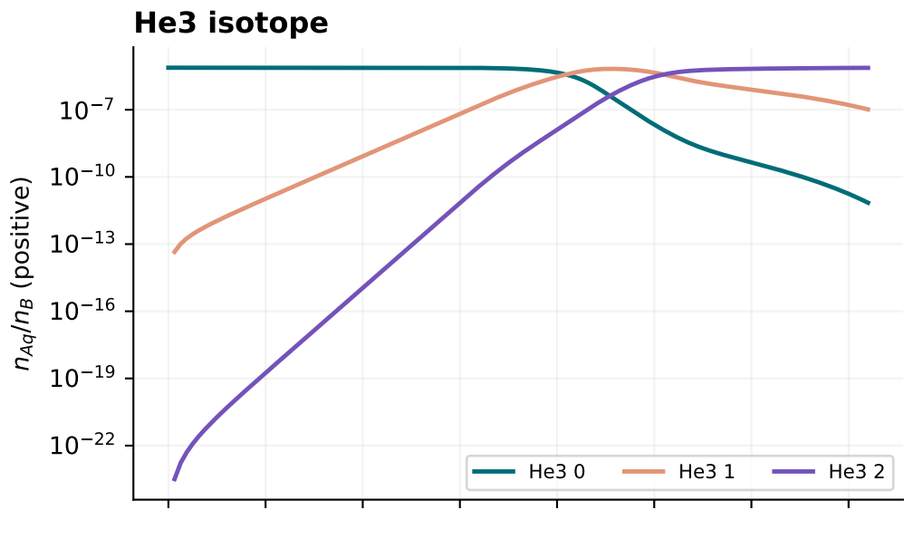
All 21 isotope-ion populations vs redshift

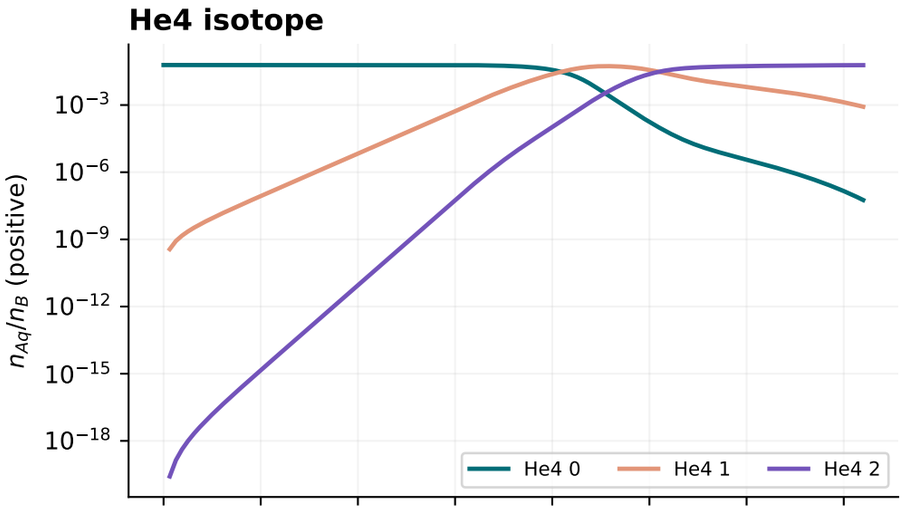
n_Aq / n_B, logarithmic positive values only. Zero/absent curves are stated in each panel; no floor or clipping.

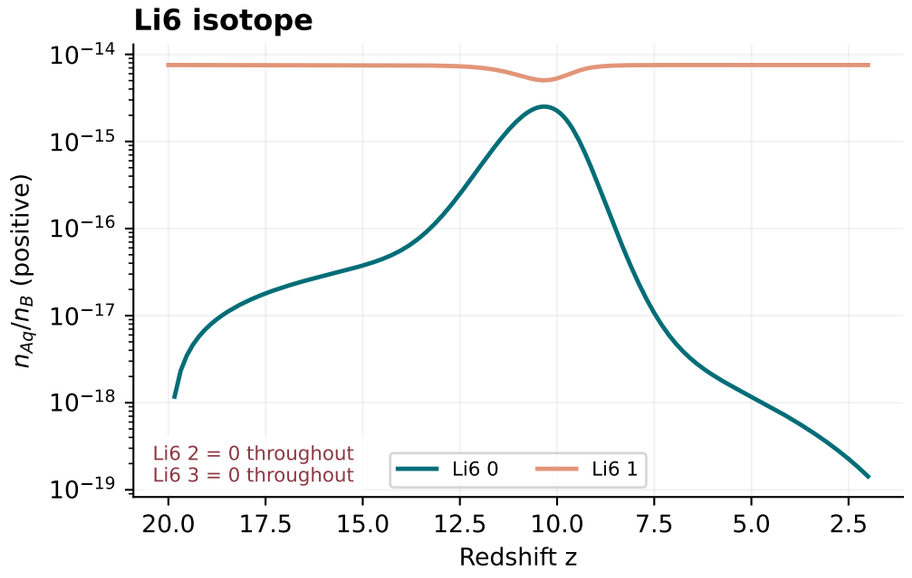


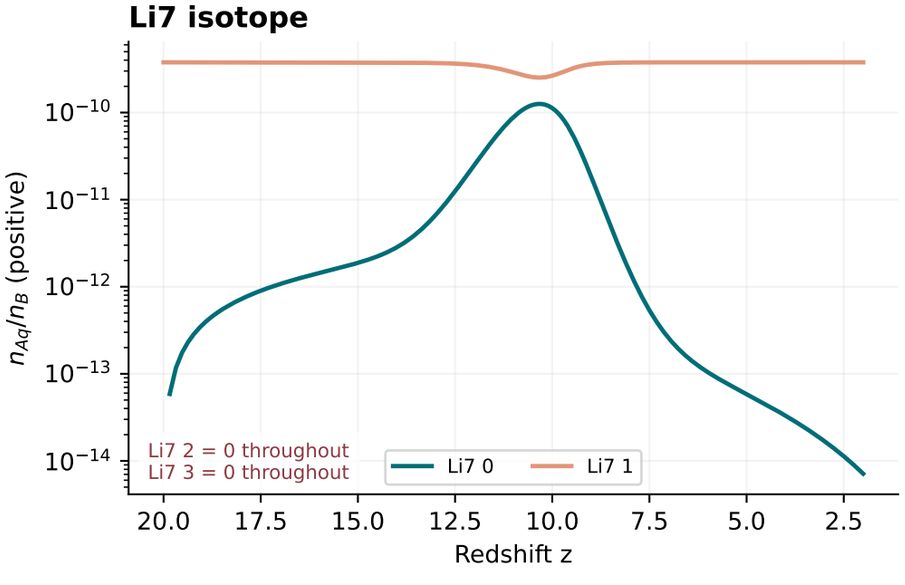












Census accounting

n^0: exactly zero · absent initial/source inventory
T^0, T^+: exactly zero · absent initial/source inventory

$Li6^{2+/3+}$ and $Li7^{2+/3+}$ (LiIII/IV): exactly zero in this soft-UV atomic pilot (Li panels).

Seven isotope panels + n^0 = 21 outputs.
Only 9 elemental conditional fractions evolve; isotope rates and initial fractions are shared.
